

Exercise 3:

The probability mass function of the multinomial distribution is:

$$P(X_1=x_1, X_2=x_2, \dots, X_k=x_k) = \frac{n!}{x_1! x_2! \dots x_k!} \times p_1^{x_1} \times p_2^{x_2} \times \dots \times p_k^{x_k}$$

Here, $n = \sum_{i=1}^k x_i$

and $\sum_{i=1}^k p_i = 1$.

use multinomial coefficient.

$$\binom{n}{x_1, x_2, \dots, x_k} = \frac{n!}{x_1! x_2! \dots x_k!}$$

The likelihood function is:

$$P(x, y, z | p) = \binom{x+y+z}{x} \times (1-p)^{2x} \times \binom{y+z}{y} \times (2p(1-p))^y \times \binom{z}{z} \times p^{2z}$$

Taking log-likelihood is given by

$$\log(P(x, y, z | p)) = \log \left[\binom{x+y+z}{x} \times (1-p)^{2x} \times \binom{y+z}{y} \times (2p(1-p))^y \times \binom{z}{z} \times p^{2z} \right]$$

$$= 2x \log(1-p) + \log \left(\frac{x+y+z}{x} \right) + y \log 2p + y \log(1-p) + \log \left(\frac{y+z}{y} \right) + 2z \log(p) + \log \left(\frac{z}{z} \right)$$

Taking the derivative w.r.t. p

$$\begin{aligned} \frac{\partial (\log(P(x, y, z | p)))}{\partial p} &= -\frac{2x}{1-p} + \frac{y}{2p} \cdot 2 - \frac{y}{1-p} + \frac{2z}{p} \\ &= \frac{y+2z}{p} - \frac{y+2x}{1-p} \end{aligned}$$

Set the derivative equal to 0.

$$\frac{y+2z}{p} - \frac{y+2x}{1-p} = 0$$

$$\Rightarrow \frac{y+2z-yp-2pz-yp-2xp}{p(1-p)} = 0$$

$$\Rightarrow y+2z - p(2y+2x+2z) = 0$$

$$\therefore \hat{p}_{MLE} = \frac{y+2z}{2x+2y+2z} \quad \checkmark$$

Taking 2nd derivative,

$$- \frac{y+2z}{p^2} - \frac{y+2x}{(1-p)^2} \quad \checkmark$$

which is < 0 , because here x, y, z are positive and the value of p is $0 < p < 1$.

So, \hat{p}_{MLE} maximizes the likelihood.
